DETAILED ACTION

Response to Amendment

1. The amendment received on 03/19/04 has been reviewed and considered with the following results:

As to the rejections to the claims, under 35 U.S.C. 112, 2nd paragraph, Applicant's amendments and clarifications have overcome the rejections, as such; the rejections have been withdrawn.

As to the prior art rejections to the claims, Applicant's amendments have overcome the rejections, as such; the prior art rejections have been withdrawn. Therefore the case is found to be in allowance condition for the reasons as set for below.

REASON FOR ALLOWANCE

2. The following is an examiner's statement of reasons for allowance:

The prior art of record does not disclose or suggest an electronic system, as recited in claims 4 and 16, comprising a first timing signal input (704 in instant Fig.7); a phase lock loop (Loop one includes 708, 710, 712, 714 716); and specifically the limitation directed to a delay line (702); a bias adjust circuit (726); and a phase detector circuit (720), the phase detector circuit for coupling a phase compare signal from the phase detection output to the first bias input (725), the phase compare signal being based on the compared phase between signals (704, 706) at the first and second phase detection inputs, and wherein the first timing signal input and the delay line output are electrically coupled to the first and second phase detection inputs, and

Art Unit: 2816

wherein the phase lock output signal is electrically coupled to the second bias input (715), the bias output of the bias adjust circuit being electrically coupled to the delay line bias input to provide a bias signal (727) to the delay line.

The prior art of record does not disclose or suggest a method (as shown in Figs. 7 and 9), as recited in claim 1, comprising the steps of generating a first current signal (715) representative of a lock condition of a phase lock loop (Loop one includes 708, 710, 712, 714 716) between a clock in signal (704) and a VCO signal (717); continuously generating a second current signal (725) representative of a phase comparison between the clock in signal and a delay line output signal (706); mixing (902) the first current signal and the second current signal resulting in a combined current signal (727); and providing the combined current signal to a bias input of the delay line to adjust the speed of at least one delay line element in the delay line thereby adjusting the relative timing position of the delay line output signal from the delay line (702).

3. Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
